Email addresses: arshad_math@hotmail.com, shakeelicp60@gmail.com, inayat64@gmail.com, fhaq2006@gmail.com ABSTRACT: A quartic B-spline collocation method is proposed for numerical solution of partial integro-differential equations with a weakly singular kernel. The scheme is developed by discretization of the time derivative using backward difference formula while the spatial derivatives are approximated using quartic $B$-spline functions. Numerical solution of five test problems is provided to validate the scheme. Accuracy of the method is assessed in terms of $L_{\infty}$ and $L_{2}$ error norms. Excellent accuracy is obtained and the results are compared with cubic B-spline collocation method.

Keywords: Collocation method, Quartic B-Spline function, Partial integro-differential equation, Weakly singular kernel.

## 1. INTRODUCTION

Partial integro-differential equations with weakly singular kernels are widely used in various fields of science and engineering such as fluid dynamics, geophysics, plasma physics, viscoelastic mechanics, civil and aerospace engineering [1-7]. This paper is concerned with the solution of a parabolic type partial integro-differential equation (PIDE) having a weakly singular kernel. Several methods have been introduced in the literature for the approximate solution of such equations (see [5, 7-13]). Yanik and Fairweather [13] used finite element methods to obtain the solution of parabolic type integro-differential equations. Le Roux and Thomee [12] solved parabolic PIDEs using finite element methods with non-smooth data. Lin and Zhang [9] used finite element methods for the stability of Ritz-Volterra projections and error estimates for a class of integro-differential equations. Pani et al. [11] obtained the numerical solutions of parabolic and hyperbolic integro-differential equations using energy methods. Tang [5] solved a second order PIDE by finite difference method. Lopez-Marcos [8] solved a nonlinear PIDE by a finite difference technique. Dehghan et al. [8, 15] obtained the numerical solution of one-dimensional and three-dimensional advection-diffusion equations using fully explicit, fully implicit and weighted finite difference methods. Nawaz et al. [10] used variational iteration method and Homotophy perturbation method for the solution of fourth-order fractional integro-differential equation. Yang et al. [7, 16] used quasi-wavelet based numerical methods for approximate solution of fourthorder partial integro-differential equations with weakly singular kernel.

In this paper we use quartic B-spline collocation method for the numerical solution of a class of partial integrodifferential equations with a weakly singular kernel. Spline was introduced by Schoenberg [17] in 1946 for smooth, piecewise polynomial approximation with applications in the aircraft and shipbuilding industries. Isaac Jacob Schoenberg used the term B-spline as short for basis spline. In 1975, Prenter [18] provided a theoretical background for stable computation using polynomial B -splines and their derivatives. The main feature of a B -spline function is its minimal support with respect to a given degree, smoothness, and domain partition [18-19]. This feature leads to a band
structure of matrices which appears in interpolation and collocation problems using B-splines. Furthermore some of the characteristics of B -splines give total positivity. As a result, Gaussian elimination without pivoting using computers can be applied for invertibility of the matrices obtained from B-splines methods. Recently, the B-spline techniques are extended for the solution of several partial differential equations and PIDEs including regularized long wave (RLW) equation [20], equal width wave (EW) equation [21], modified regularized long wave (MRLW) equation [22], fourth order PIDE [23], parabolic type PIDE [24] and PIDEs using sixth-degree B-spline function technique [25].

## 2. CONSTRUCTION OF PROPOSED METHOD

Consider the following partial integro- differential equation [4]:

$$
\begin{align*}
& u_{t}(x, t)+m u_{x}(x, t)-w u_{x x}(x, t)=\int_{0}^{t} K(t- \\
& s) u(x, s) d s+f(x, t), x \in[a, b], t>0,  \tag{1}\\
& \text { subject to the initial condition: } \\
& u(x, 0)=g(x), \quad x \in[a, b],  \tag{2}\\
& \text { and boundary conditions: } \\
& \quad u(a, t)=\beta_{1}(t), \\
& \quad u_{x}(a, t)=\beta_{2}(t),  \tag{3}\\
& \quad u(b, t)=\beta_{3}(t), t>0 .
\end{align*}
$$

Eq. (1) is used to describe convection-diffusion phenomena. The coefficients $m$ and $w$ are positive constants which are used to quantify the advection (convection) and diffusion process, the integral term is called memory and the weakly singular kernel is given by
$K(t-s)=(t-s)^{-\alpha}, 0<\alpha<1$.
The time derivative in Eq. (1) is discretized by first order forward difference formula at time level $n+1$ and quartic Bsplines will be used to approximate the space derivatives. Let $t^{n}=n \delta t$, where $\delta t$ is the time step and $t^{n+1}=t^{n}+$ $\delta t, n=0,1,2 \ldots$ Approximation of time derivative in Eq. (1) yields

$$
\begin{equation*}
u_{t}\left(x, t^{n+1}\right) \approx \frac{u\left(x, t^{n+1}\right)-u\left(x, t^{n}\right)}{\delta t} \tag{4}
\end{equation*}
$$

Substituting Eq. (4) in Eq. (1) we get

$$
\begin{align*}
& \frac{u\left(x, t^{n+1}\right)-u\left(x, t^{n}\right)}{\delta t}+m u_{x}\left(x, t^{n+1}\right)-w u_{x x}\left(x, t^{n+1}\right)= \\
& \int_{0}^{t^{n+1}} K\left(t^{n+1}-s\right) u(x, s) d s+f\left(x, t^{n+1}\right) \tag{5}
\end{align*}
$$

The integral part in Eq. (5) is evaluated as follows [4-5]:
$\int_{0}^{t^{n+1}} K\left(t^{n+1}-s\right) u(x, s) d s$
$=\int_{0}^{t^{n+1}} s^{-\alpha} u\left(x, t^{n+1}-s\right) d s$
$=\sum_{j=0}^{n} \int_{t^{j}}^{t^{j+1}} s^{-\alpha} u\left(x, t^{n+1}-s\right) d s$
$\approx \sum_{j=0}^{n} u\left(x, t^{n-j+1}\right) \int_{t^{j}}^{t^{j+1}} s^{-\alpha} d s$. (6)
Substituting Eq. (6) in Eq. (5), we obtain
$\frac{u\left(x, t^{n+1}\right)-u\left(x, t^{n}\right)}{\delta t}+m u_{x}\left(x, t^{n+1}\right)-w u_{x x}\left(x, t^{n+1}\right)=$ $\frac{(\delta t)^{1-\alpha}}{1-\alpha} \sum_{j=0}^{n} u\left(x, t^{n-j+1}\right)\left[(j+1)^{1-\alpha}-j^{1-\alpha}\right]+f\left(x, t^{n+1}\right)$.

Eq. (7) can be rearranged as
$u^{n+1}(x)+m \delta t u_{x}{ }^{n+1}(x)-w \delta t u_{x x}{ }^{n+1}(x)-$
$\frac{(\delta t)^{2-\alpha}}{1-\alpha} u^{n+1}(x)=u^{n}(x)+\frac{(\delta t)^{2-\alpha}}{1-\alpha} \sum_{j=1}^{n} b_{j} u^{n-j+1}(x)+$
$\delta t f^{n+1}(x), \quad n \geq 1$,
where $u^{n+1}(x)=u\left(x, t^{n+1}\right), f^{n+1}(x)=f\left(x, t^{n+1}\right)$ and $b_{j}=(j+1)^{1-\alpha}-j^{1-\alpha}, j=1,2,3, \ldots$
To find the numerical solution of problem (1)-(3) using the scheme (8), the interval $[a, b]$ is partitioned into $N$ finite elements of consistently equal length $h$ by the grid points $x_{i}, i=1,2,3, \ldots N$, such that $a=x_{0}<x_{1}<x_{2} \ldots \ldots . .<$ $x_{N}=b$ and $h=\frac{b-a}{N}$. The Quartic B-splines function $B_{i}(x), i=-2,-1,0, \ldots . . N+1$ at these knots are given by $B_{i}(x)=$

$$
\frac{1}{h^{4}}\left\{\begin{array}{cc}
a_{1}=\left(x-x_{i-2}\right)^{4}, & x \in\left[x_{i-2}, x_{i-1}\right]  \tag{9}\\
a_{2}=a_{1}-5\left(x-x_{i-1}\right)^{4}, & x \in\left[x_{i-1}, x_{i}\right] \\
a_{3}=a_{2}+10\left(x-x_{i}\right)^{4}, & x \in\left[x_{i}, x_{i+1}\right] \\
\left(x_{i+3}-x\right)^{4}-5\left(x_{i+2}-x\right)^{4}, & x \in\left[x_{i+1}, x_{i+2}\right] \\
\left(x_{i+3}-x\right)^{4}, & x \in\left[x_{i+2}, x_{i+3}\right] \\
0, & \text { otherwise } .
\end{array}\right.
$$

The set of quartic B-splines $\left\{B_{-2}, B_{-1}, B_{0}, \ldots, B_{N}, B_{N+1}\right\}$ forms a basis for the functions over the interval $[a, b]$. A global approximation $U(x, t)$ to the exact solution $u(x, t)$ takes the form
$U(x, t)=\sum_{i=-2}^{N+1} \gamma_{i}(t) B_{i}(x)$,
where $\gamma_{i}(t)$ are unknown time dependent quantities to be determined from collocation, boundary and initial conditions. The nodal values $U_{i}$, the first and second derivatives $U_{i}{ }^{\prime}$ and $U_{i}{ }^{\prime \prime}$ at the knots are obtained from Eqs. (9) and (10) in the following form

$$
\left.\begin{array}{c}
U_{i}=U\left(x_{i}\right)=\gamma_{i-2}+11 \gamma_{i-1}+11 \gamma_{i}+\gamma_{i+1} \\
U_{i}^{\prime}=U^{\prime}\left(x_{i}\right)=\frac{4}{h}\left(-\gamma_{i-2}-3 \gamma_{i-1}+3 \gamma_{i}+\gamma_{i+1}\right)  \tag{11}\\
U_{i}^{\prime \prime}=U^{\prime \prime}\left(x_{i}\right)=\frac{12}{h^{2}}\left(\gamma_{i-2}-\gamma_{i-1}-\gamma_{i}+\gamma_{i+1}\right)
\end{array}\right\}
$$

where dashes represent differentiation with respect to space variable. To develop the general scheme consider Eq. (8) and substituting the approximate values of $u^{n+1}(x), u_{x}{ }^{n+1}(x)$ and $u_{x x}{ }^{n+1}(x)$ at $x=x_{i}, i=0,1,2, \ldots, N$, using Eq. (11), we get $C_{1} \gamma_{i-2}^{n+1}+C_{2} \gamma_{i-1}^{n+1}+C_{3} \gamma_{i}^{n+1}+C_{4} \gamma_{i+1}^{n+1}=F_{i}$,
where

$$
\begin{align*}
& C_{1}=1-\frac{4}{h} m \delta t-\frac{12}{h^{2}} w \delta t-\frac{(\delta t)^{2-\alpha}}{1-\alpha}  \tag{12}\\
& C_{2}=11-\frac{12}{h} m \delta t+\frac{12}{h^{2}} w \delta t-11 \frac{(\delta t)^{2-\alpha}}{1-\alpha}
\end{align*}
$$

$C_{3}=11+\frac{12}{h} m \delta t+\frac{12}{h^{2}} w \delta t-\frac{(\delta t)^{2-\alpha}}{1-\alpha}$,
$C_{4}=1+\frac{4}{h} m \delta t-\frac{12}{h^{2}} w \delta t-\frac{(\delta t)^{2-\alpha}}{1-\alpha}$,
$F_{i}=u^{n}\left(x_{i}\right)+\frac{(\delta t)^{2-\alpha}}{1-\alpha} \sum_{j=1}^{n} b_{j} u^{n-j+1}\left(x_{i}\right)+\delta t f^{n+1}\left(x_{i}\right)$.
Eq. (12) represent a system of $N+1$ equations in $N+4$ unknowns $\gamma_{i}, i=-2,-1, \ldots, N+1$. In order to get a unique solution; we eliminate the parameters $\left\{\gamma_{-2}, \gamma_{-1}, \gamma_{N+1}\right\}$. The values of these parameters can be calculated from the boundary conditions (3) and (11). The linear system can be solved by a four-diagonal solver successively once initial time solution is obtained from Eqs. (2)-(3). Finally the the approximate solution will be obtained from Eq. (10).

## 3. NUMERICAL TESTS AND PROBLEMS

In this section we present some examples in order to test the scheme (12) for the solution of the problem defined in Eqs. (1)-(3). All the computations are carried out through Matlab using Intel Core i5 processor with 4 GB RAM. For the sake of comparison all the examples are taken from those given in reference [4].
Example 1: Consider Eq. (1) with the parameters $m=$ $0.05, w=0.4, \alpha=\frac{1}{2}$ and choose $f(x, t)$ so that the exact solution is
$u(x, t)=(t+1)^{2} \sin \pi x$.
The initial and boundary conditions are given as:
$u(x, 0)=\sin \pi x, 0 \leq x \leq 1$,
$u(0, t)=0, u_{x}(0, t)=\pi(t+1)^{2}$ and $u(1, t)=0$.
Numerical simulations are performed with $h=0.01,0.02, \delta t=0.0001,0.00001, m=0.05, \quad w=0.4$ and the error norms $L_{\infty}$ and $L_{2}$ at various time levels are recorded in Tables 1-2 along with the results of cubic Bspline collocation method given in [4]. Better accuracy of the present method than cubic B-spline collocation method [4] is evident from Tables 1-2. Fig. 1 presents exact and approximate solutions obtained through the present method corresponding to $M=500$ whereas Fig. 2 shows the error plot at $M=500$. Fig. 3 represents the quartic B-spline solutions at various time levels.

Example 2: In this example we consider Eq. (1) with the parameters $m=0.005, w=0.5, \alpha=\frac{1}{3}$ and $f(x, t)$ is chosen so that the exact solution of Eq. (1) is given by
$u(x, t)=(t+1)^{2}(1-\cos 2 \pi x)+2 \pi^{2} x(1-x) .(13)$
The initial and boundary conditions are extracted from Eq. (13). Computations are carried out using the parameters values $h=0.01,0.02, \delta t=0.0001,0.00001, m=0.005$, $w=0.5$ and the error norms $L_{\infty}$ and $L_{2}$ at various time levels are noted in Tables 3-4 along with the results of cubic Bspline collocation method given in [4]. Higher accuracy of the present method than cubic B-spline collocation method is observed form Tables 3-4. Fig. 4 shows exact and approximate solution obtained through the present method at $M=500$.

Table 1: Error norms produced by Quartic B-spline collocation method along with the results of [4] corresponding to Example-1

|  | Quartic B-spline |  |  | Cubic B-spline [4] |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $h$ | M | $L_{\infty}$ | $L_{2}$ | $L_{\infty}$ | $L_{2}$ |

|  | 50 | $5.27 \times$ | $3.69 \times$ | $1.14 \times$ | $3.31 \times$ |
|  |  | $10^{-7}$ | $10^{-8}$ | $10^{-5}$ | $10^{-7}$ |
|  | 10 | $1.09 \times$ | $7.66 \times$ | $1.19 \times$ | 5.73× |
|  | 0 | $10^{-6}$ | $10^{-8}$ | $10^{-5}$ | $10^{-7}$ |
|  | 50 | $5.92 \times$ | $4.15 \times$ | $3.53 \times$ | $2.43 \times$ |
|  | 0 | $10^{-6}$ | $10^{-7}$ | $10^{-5}$ | $10^{-6}$ |
| 0.0 | 10 | $9.32 \times$ | $9.14 \times$ | $2.64 \times$ | $5.62 \times$ |
| 2 |  | $10^{-8}$ | $10^{-9}$ | $10^{-5}$ | $10^{-7}$ |
|  | 50 | $5.28 \times$ | $5.18 \times$ | $3.98 \times$ | 1.08× |
|  |  | $10^{-7}$ | $10^{-8}$ | $10^{-5}$ | $10^{-6}$ |
|  | 10 | $1.09 \times$ | $1.07 \times$ | $4.40 \times$ | $1.39 \times$ |
|  | 0 | $10^{-6}$ | $10^{-7}$ | $10^{-5}$ | $10^{-6}$ |
|  | 50 | $5.94 \times$ | $5.82 \times$ | $5.36 \times$ | $2.86 \times$ |
|  | 0 | $10^{-6}$ | $10^{-7}$ | $10^{-5}$ | $10^{-6}$ |

Example 3: Consider Eq. (1) with the parameters $m=$ $0.5, w=0.005, \alpha=\frac{1}{3}$. The initial and boundary conditions for the given problem are defined as:
$u(x, 0)=\cos \pi x, 0 \leq x \leq 1$,
$u(0, t)=t+1, u_{x}(0, t)=0, u(1, t)=-(t+1)$.
The exact solution of the problem is given by
$u(x, t)=(t+1) \cos \pi x$.
Numerical simulations are done using $h=0.01, \delta t=$ $0.0001,0.00001, m=0.5, w=0.00$. The error norms $L_{\infty}, L_{2}$ at various time levels are reported in Tables (5)-(6) along with the results of cubic B -spline collocation method. Excellent accuracy of the present method than cubic B-spline collocation method [4] is seen form Tables (5)-(6).

Figure 1: Quartic B-spline and exact solution for Example-1 for $h=0.02, \delta t=0.0001$.

Example 4: Consider Eq. (1) with the parameters $m=$ $0.1, w=0.1, \alpha=\frac{1}{4}$. The initial and boundary conditions for the given problem are defined as
$u(x, 0)=0,0 \leq x \leq 4 \pi$,
$u(0, t)=0, u_{x}(0, t)=0, u(1, t)=0$.
The exact solution of the problem is given by
$u(x, t)=2(t+1) \sin ^{2} x, 0 \leq x \leq 4 \pi$.
Numerical simulations are done using $N=10,50$,
$\delta t=0.0001,0.00001$. The error norms $L_{\infty}, L_{2}$ at various time levels are reported in Tables (7)-(8) along with the results of cubic B -spline collocation method. Better accuracy of the present method than cubic B-spline collocation method is seen form Tables (7)-(8).
Example 5: In this example we take parameters $m=$ $0.5, w=0.001, \alpha=\frac{1}{4}$. The initial and boundary conditions for the problem are given as
$u(x, 0)=2 \sin ^{2} \pi x, 0 \leq x \leq 1$,
$u(0, t)=0, u_{x}(0, t)=0$ and $u(1, t)=0$.
The exact solution of the problem is given by
$u(x, t)=2\left(t^{2}+t+1\right) \sin ^{2} \pi x$.
Computations are performed using $h=0.01,0.1,0.02$, $\delta t=0.0001,0.00001$. The error norms $L_{\infty}, L_{2}$ at different time levels are recorded in Tables (9)-(10) along with the results of cubic B-spline collocation method. From Tables (9)-(10) comparable accuracy of the present method than cubic B-spline collocation method can be observed. Fig. 7 shows exact and approximate solution using the present method at $M=500$.

## 4. CONCLUSION

Quartic B-spline collocation method is used to obtain the approximate solution of parabolic type partial integrodifferential equations with a weakly singular kernel. The proposed method is implemented with five test problems from literature for its validity. The accuracy of the method is examined through two error norms $L_{\infty}, L_{2}$ and by comparison with cubic B-spline collocation method. It has been observed that the errors are sufficiently small. Simple applicability and excellent accuracy of the quartic B-Spline collocation method provide that this method can be employed for numerical approximation of integral equations, partial differential equations and partial integro-differential equations of such type.
