#### Abstract

For a given group $G$ and a subset $A \subseteq G-Z(G)$, the non-commuting graph $\Delta=[G, A]$ of the group $G$ is a graph with vertex-set $V(\Delta)=A$ such that two distinct vertices $x, y \in V(\Delta)$ are connected by an edge i. e $x y \in E(\Delta)$ if and only if $x y=y x$ in G. In this paper, we study the certain properties of non-commuting graph on Dicyclic group DiCn $=\left\langle a, x: a^{2 n}=1, x^{2}=a^{n}, a^{x}=a^{-1}\right\rangle$ of order $4 n$ and obtained certain parameters of graph theory as chromatic number, clique number and perfect matching.

Keywords: Non-Commuting Graph, Dicyclic Group, Clique Number, Chromatic number. MR(2010) SubjectClassification:05C12.

## INTRODUCTION:

As we know, the algebraic structures pay a very important rule in the studies of different branches of Mathematics. The involvement of these structures in Graph Theory has become one of attractive research activities for Mathematicians of modern era. Therefore, in the literature, there are many graphs like zero-divisor graphs, total graphs, commutative graphs and non-commutative graphs. These graphs have been constructed from commutative rings and finite groups under certain algebraic properties of idealization, modules, commutatively and noncommutatively, respectively. For a detail study, reader can see $[2,3,5-7]$. Now, we focus on the graphs, constructed from finite groups. Segevand Seitz [13, 14] investigated the commuting graphs from non abelian simple groups. Iranmanesh and Jafarzadeh [9] associated the commuting graphs with symmetric and alternating groups. In 2011, Chelvametal. [8] and Mashkourietal. [10] found commutating graphs from dihedral groups. Abdullah oetal. [1] and Moghaddam faretal. [11] constructed non-commuting graphs on different types of groups. In particularly, Asghar Talebi [4] constructed then on-commuting graphs of the Dihedral group.
In this paper, we construct the non-commuting graphs from non-abelian and finite groups called dicyclic groups $\mathrm{DiC}_{\mathrm{n}}$ with respect to its some specified sub sets. The of paper is organized as follows; the section 2 contains some notations and basic definitions, while section 3 includes main results of commuting graphs.

## 2 Preliminaries:

Consider simple, finite and undirected graphs. For a graph $\Delta$, we denote the vertex-set and edge-set by $\mathrm{V}(\Delta)$ and $\mathrm{E}(\Delta)$, respectively. Moreover, $\mathrm{m}=|\mathrm{E}(\Delta)|$ and $\mathrm{n}=|\mathrm{V}(\Delta)|$ are called size and order of the graph $\Delta$. The degree of a vertex $\mathrm{v} \in$ $\mathrm{V}(\Delta)$, denoted by $\operatorname{deg} \Delta(\mathrm{v})$ is number of incident edges on v . A graph is regular if all the vertices are of same degree. A graph of order $n$ is called a complete graph if each pair of vertices is adjacent. It is denoted by $\mathrm{K}_{\mathrm{n}}$ and is $\mathrm{n}-1$ regular. For $\mathrm{n}=2$, it is also called a path of order 2 such that both vertices are of degree 1 . A friendship graph $\mathrm{F}_{\mathrm{m}}$ consists of m
triangles with exactly one common vertex, this common vertex is called the center of $\mathrm{F}_{\mathrm{m}}$.
A subset $X$ of $V(\Delta)$ is said to be clique if the sub graph induced by X is a complete graph. The maximum size of a clique in a graph $\Delta$ is called clique number of $\Delta$. It is denoted by $\omega(\Delta)$. For $\mathrm{k}>0$ (an integer), k-vertex coloring of the graph $\Delta$ is an assignment of $k$-colors to the vertices of $\Delta$ such that no two adjacent vertices have same color. The chromatic number of $\Delta$ (denoted by $\chi(\Delta)$ ) is the minimum k for which $\Delta$ has k-vertex coloring. A graph $\Delta$ is k-colorable (edge), if its edges can be colored with k -colors such that no two adjacent edges have same color. It is denoted by $\chi^{0}(\Delta)$ and called chromatic index of $\Delta$. Length of minimal cycle in a graph $\Delta$ is called girth of $\Delta$. If $u$ and $v$ are the vertices in $\Delta$, the $\mathrm{d}(\mathrm{u}, \mathrm{v})$ denotes the distance between u and v (length of shortest path between $u$ and $v$ ). The largest distance between all the pairs of vertices of $\Delta$ is called the diameter of $\Delta$ and is denoted by $\operatorname{dia}(\Delta)$. A matching on a graph $\Delta$ is a sub set of $\Delta$ such that no two edges share a common vertex in it and order of this subset is called matching number of $\Delta$ denoted by $\gamma(\mathrm{G})$. The largest possible matching on a graph with $n$ nodes consists of $n / 2$ edges and such a matching is called a perfect matching. The center of a group $G$ is denoted by $Z(G)$ and defined as $Z(G)=\{x \in G$ : $x y=y x$ for all $y$ $\in G\}$. Let a be any non-identity element to $f G$, then centralizer of a in $G$ is the set of elements of $G$ which commutes with a and it is denoted by $\mathrm{C}_{\mathbf{a}}(\mathrm{G})$. On the other hand, $\overline{\mathrm{C}_{\mathrm{a}}(\mathrm{G})}$ presents the set of elements which do not commute with a in $G$.
Moreover, for $a \in A \subseteq \underline{G}, C_{a}(G, A)$ is set of elements of $A$ which commutes with a and
$\overline{C_{a}(G, A)}$ is set of elements of $A$ which do not commute with a . Thus, if $\mathrm{A}=\mathrm{G}$, then $\mathrm{C}_{\mathrm{a}}(\mathrm{G}, \mathrm{A})=\mathrm{C}_{\mathrm{a}}(\mathrm{G})$ and $\overline{\mathrm{C}_{\mathrm{a}}(\mathrm{G}, \mathrm{A})}=\overline{\mathrm{C}_{\mathrm{a}}(\mathrm{G})}$. The Dicylic group is represented by
$\mathrm{DiC}_{\mathrm{n}}=<\mathrm{a}, \mathrm{x}: \mathrm{a}^{2 \mathrm{n}}=1, \mathrm{x}^{2}=\mathrm{a}^{\mathrm{n}}, \mathrm{a}^{\mathrm{x}}=\mathrm{a}^{-1}>$ under the following multiplication rules; (i) $a^{s} a^{t}=a^{s+t}$, (ii) $a^{s} a^{t} x=a^{s+t} x$,
(iii) $a^{s} \mathrm{xa}^{t}=\mathrm{a}^{\mathrm{s}-\mathrm{t}} \mathrm{x}$,
(iv) $a^{s} \mathrm{xa}^{t} \mathrm{x}=\mathrm{a}^{\mathrm{s}-\mathrm{t}+\mathrm{n}}$.

It is a member of a class of non-abelian groups of order $4 n$, where $n>1$. Every element of Dicyclic group can be written in the forma ${ }^{i}{ }^{j}$, where $i \in\{0,1,2, \ldots, 2 n-1\}$ and $j$ is 0 or 1 . Suppose that $\mathbf{I}_{1}=\{1,2, \ldots, \mathrm{n}-1, \mathrm{n}+1, \ldots, 2 \mathrm{n}-1\}$,
$\mathrm{I}_{2}=\{1,2, \ldots, \mathrm{n}\}, \mathrm{I}_{3}=\{\mathrm{n}+1, \mathrm{n}+2, \ldots, 2 \mathrm{n}\}$
and $\mathrm{I}_{4}=\mathrm{I}_{2} \cup \mathrm{I}_{3}$ then
$A_{1}=\left\{a^{i}: i \in I_{1}\right\}, B_{i}=\left\{a^{i} x, a^{n+I} x: i \in I_{2}\right\}$,
$\mathrm{B}=\mathrm{U}_{i \in \mathrm{I}} \mathrm{B}_{\mathrm{i}} \mathrm{C}_{1}=\left\{\mathrm{a}^{\mathrm{i} \mathrm{x}}: \mathrm{i} \in \mathrm{I}_{2}\right\}$,
$C_{2}=\left\{\mathrm{a}^{\mathrm{i}} \mathrm{x}: \mathrm{i} \in \mathrm{I}_{3}\right\}$,
$D_{i}=\left\{a^{i}, a^{i} x: i \in I_{1}\right\}$,
are suitable subsets of $D_{i} C_{n}$.

## 3 MAIN RESULTS

In this section, we present the main results of the non-commuting graphs $\Delta=\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right]$, Where A $\subseteq \mathrm{DiC}_{\mathrm{n}}$.
Lemma3.1. For $\mathrm{n} \geq 2$ and $\mathrm{A}=\mathrm{DiC}_{\mathrm{n}}$, if $\Delta=$ $\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then, 2 n , for $\mathrm{v} \in \mathrm{A}_{1}$
$\operatorname{deg} \Delta(v)=\left\{\begin{array}{c}2 n, \text { for } v \in A_{1} \\ 4(n-1), \quad v \in B .\end{array}\right.$
Proof: Let $v=a^{i} \in A_{1}$, where $i \in I_{1}$. Then, $C_{a^{i}}\left(\mathrm{DiC}_{\mathrm{n}}\right)=\left\{\mathrm{a}^{\mathrm{j}} \mathrm{x}: \mathbf{j}=1,2, \ldots, 2 \mathrm{n}\right\}$.
Therefore, for $i \in I_{1}$, we have $\operatorname{deg} \Delta\left(a^{i}\right)=2 n$. Consequently, $\operatorname{deg} \Delta(v)=2 n$ for each $v \in A_{1}$.
For $v=a^{i}{ }^{i} \in B$, where $i \in\{1,2,3, \ldots, 2 n\}$, we have $\mathrm{C}_{\mathrm{a}^{\mathrm{i}}}\left(\mathrm{DiC}_{\mathrm{n}}\right)=\left\{\mathrm{a}^{\mathrm{j}} \mathrm{x}: \mathrm{j}=1,2, \ldots, 2 \mathrm{n}, \mathrm{j} \neq \mathrm{I}\right.$ and $\mathbf{j} \neq \mathrm{n}+\mathbf{i}\} \cup\left\{\mathrm{a}^{\mathrm{j}}: \mathbf{j} \in \mathrm{I}_{1}\right\}$. Thus, $\operatorname{deg} \Delta\left(\mathrm{a}^{\mathrm{i}} \mathrm{x}\right)=$ $4(n-1) \Rightarrow \operatorname{deg} \Delta(v)=4(n-1)$ for $v \in B \operatorname{deg} \Delta$ $\left(\mathrm{a}^{\mathrm{i} x}\right)=4(\mathrm{n}-1) \Rightarrow \operatorname{deg} \Delta(\mathrm{v})=4(\mathrm{n}-1)$ for $\mathrm{v} \in \mathrm{B}$
Lemma3.2. For $n \geq 2$ and $A \subseteq \mathrm{DiC}_{n}$, if $\Delta$ $=\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then, the following are true;
(i) If A is an abelian subgroup of $\mathrm{DiC}_{\mathrm{n}}$, then $\operatorname{dia}(\Delta)=\infty$.
(ii) If $\mathrm{A}=\mathrm{DiC}_{\mathbf{n}}-\mathrm{Z}\left(\mathrm{DiC}_{\mathbf{n}}\right)$, then $\operatorname{dia}(\Delta)=2$.

Proof; (i) Since A is an abelian subgroup of $\mathrm{DiC}_{\mathbf{n}}$, then the non-commuting graph.
$\Delta=\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right]$ is an empty graph and hence $\operatorname{dia}(\Delta)=\infty$.
(ii) If $\mathrm{A}=\mathrm{DiC}_{\mathrm{n}}-\mathrm{Z}\left(\mathrm{DiC}_{\mathrm{n}}\right)$, then non-commuting graph is multipartite graph. So, $\operatorname{dia}(\Delta)=2$.
Theorem3.3. For $\mathrm{n} \geq 2$ and $\mathrm{A} \subseteq \mathrm{DiC}_{\mathbf{n}}$, if $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then, (i) $\Delta$ is an empty graph of order $2 \Leftrightarrow A=B_{i}$ for some $i \in I_{2}$ or $A=X$, where $X \subset A_{1}$ such that $|X|=2$.
(i) $\Delta$ is an empty graph of order $2 \mathrm{n}-2 \Leftrightarrow \mathrm{~A}=\mathrm{A}_{1}$.
(ii) $\Delta=K_{n+1} \Leftrightarrow A=C_{1} \cup\{u\}$ or $C_{2} \cup\{u\}$ for some $u \in$ A1.
Proof: (i)(case-i)
Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is an on-commuting graph such that $\mathrm{A}=\mathrm{B}_{\mathbf{i}}$ for some $\mathrm{i} \in \mathrm{I}_{2}$. $\mathrm{As}_{\mathbf{C}} \overline{\mathrm{i}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{B}_{\mathbf{i}}\right)}=\Phi$ $=\overline{C_{\mathbf{a}} \mathbf{i}+\mathbf{n}_{\mathbf{X}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{B}_{\mathbf{i}}\right)}$ for each $\mathrm{i} \in \mathrm{I}_{2} \Rightarrow \operatorname{deg} \Delta\left(\mathrm{a}^{\mathbf{i}}\right)=0=$ $\operatorname{deg} \Delta\left(\mathrm{a}^{\mathrm{i}} \mathrm{x}\right)$.

Moreover, $\left|\mathrm{B}_{\mathbf{i}}\right|=2$ for each $\mathrm{i} \in \mathrm{I}_{2}$. Thus, $\Delta$ is an empty graph of order 2. (case-ii)Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $A=X$, where $X \subset A_{1}$ with $|X|=2$. As each element of $A_{1}$ commutes with others in $A_{1}$, there for both element of $X$, say $a$ and $b$ commutes with each other. Thus, $\overline{\mathrm{C}_{\mathrm{a}}\left(\mathrm{DiC}_{\mathrm{n}}, \mathrm{X}\right)}=\Phi=$
$\overline{\mathrm{C}_{\mathrm{b}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{X}\right)} \Rightarrow \operatorname{deg} \Delta(\mathrm{a})=0=\operatorname{deg} \Delta(\mathrm{b})$. Thus, $\Delta$ is an empty graph of order
2. Conversely, assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a noncommuting graph such that $\Delta$ is an empty graphoforder2. Let $\mathrm{v} \in \mathrm{A} \Rightarrow \mathrm{v} \in \mathrm{V}(\Delta) \Rightarrow \operatorname{deg} \Delta(\mathrm{v})=0 \Rightarrow$. Thus, $\mathrm{v} \in \mathrm{B}_{\mathrm{i}}$ for some $i \in I_{2}$ or $v \in X$. If $v \in B_{i}$ for some $I \in I_{2} \Rightarrow A \subseteq B_{i}$ and also $\mathrm{B}_{\mathbf{i}} \subseteq \mathrm{A}$. Consequently, $\mathrm{A}=\mathrm{B}_{\mathrm{i}}$ for some i. If $\mathrm{v} \in \mathrm{X} \Rightarrow \mathrm{A} \subseteq X$ and also $\mathrm{X} \subseteq \mathrm{A}$. Consequently, $\mathrm{A}=\mathrm{X}$.
(ii) Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $A=A_{1}$. As
$\overline{\mathrm{C}_{\mathrm{a}}\left(\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}_{1}\right)}=\Phi$ for each $\mathrm{a} \in \mathrm{A}_{1} \Rightarrow \operatorname{deg} \Delta(\mathrm{a})=0$ for each $\mathrm{a} \in \mathrm{A}_{1}$.Thus, $\Delta$ is an empty graph. Also $|\mathrm{A}|=2 \mathrm{n}-2 \Rightarrow \Delta$ is anemptygraphoforder2n-2.Conversely, assume that $\Delta=$ $\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that
$\Delta$ is an empty graph of order $2 n-2$. Let $v \in A \Rightarrow v \in V(\Delta) \Rightarrow$ $\operatorname{deg} \Delta(v)=0 \Rightarrow \mathrm{v}$ commutes with each element of A . Thus, $\mathrm{v} \in \mathrm{A}_{1} \Rightarrow \mathrm{~A} \subseteq \mathrm{~A}_{1}$ and also $\mathrm{A}_{1} \subseteq \mathrm{~A}$. Consequently, $\mathrm{A}=\mathrm{A}_{1}$.
(iii) Assume that $\Delta=\left[\mathrm{Di} \mathrm{C}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $A=C_{1} \cup\{u\}$, where $u \in A_{1}$. Then, $\overline{\left|\mathrm{C}_{\mathrm{V}}\left(\mathrm{DiC}_{n}, \mathrm{~A}\right)\right|}=\mathrm{n}$ for each $\mathrm{v} \in \mathrm{C}_{1} \cup\{u\} \Rightarrow \operatorname{deg} \Delta(\mathrm{v})=\mathrm{n}$ for each $v \in C_{1} \cup\{u\}$. Thus, $\Delta$ is a complete graph of order $\mathrm{n}+1 \Rightarrow \Delta=\mathrm{K}_{\mathrm{n}+1}$. Conversely, assume that $\Delta=\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $\Delta=K_{n+1}$. Let $v \in A$ $\Rightarrow \mathrm{v} \in \mathrm{V}(\Delta) \Rightarrow \mathrm{v} \in \mathrm{K}_{\mathrm{n}+1} \Rightarrow \operatorname{deg} \Delta(\mathrm{v})=\mathrm{n} \Rightarrow \mathrm{v}$ does not commute with $n$ elements of $A$. Thus, $v \in C_{1} \cup\{u\}$ for some $u$ $\in A_{1} \Rightarrow A \subseteq C_{1} \cup\{u\}$ and also $C_{1} \cup\{u\} \subseteq A$. Consequently, $A=C_{1} \cup\{u\}$. Similarly, we can prove for $A=C_{2} \cup\{u\}$. Corollary 3.4. For $\mathrm{n} \geq 2$ and $\mathrm{A} \subseteq \mathrm{DiC}_{\mathbf{n}}$, if $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then $\Delta=K_{n} \Leftrightarrow A=C_{1}$ or $C_{2}$.

Theorem3.5. For $\mathrm{n} \geq 2$ and $\mathrm{A} \subseteq \mathrm{DiC}_{\mathbf{n}}$, if $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then, (i) $\Delta$ is a star graph $S(2 n-2)$ $\Leftrightarrow A=A_{1} \cup\{u\}$ for some $u \in B$.
(ii) $\Delta=K_{2 n-2,2,2,2, \ldots,} \Leftrightarrow A=A_{1} \cup B$

Proof: (i) Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $A=A_{1} \cup\{u\}$ for
Some $u \in B . A s \overline{\overline{\left|C_{u}\left(D_{i} C_{n}, A\right)\right|}}=\left|A_{1}\right|=2 n-2$ for each $u \in B$ and $\overline{\left|\mathrm{C}_{\mathrm{V}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)\right|}=1$ for each $\mathrm{v} \in \mathrm{A}_{1}$. Thus, $\Delta$ is a graph such that one vertex is of degree $2 \mathrm{n}-2$ and remaining vertices are pendent $\Rightarrow \Delta=S(2 n-2)$.
Conversely, assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a noncommuting graph such that $\Delta=S(2 n-2)$. Let $v \in A \Rightarrow v \in$ $\mathrm{V}(\Delta) \Rightarrow \mathrm{v} \in \mathrm{S}(2 \mathrm{n}-2) \Rightarrow$ either $\operatorname{deg} \Delta(\mathrm{v})=2 \mathrm{n}-2$ or $\operatorname{deg} \Delta(\mathrm{v})=$ 1. If $\operatorname{deg} \Delta(v)=2 n-2 \Rightarrow v$ does not commute with $2 n-2$ elements of $A \Rightarrow v \in A_{1} \cup\{u\}$ for some $u \in B$. If $\operatorname{deg} \Delta(v)$ $=1$, where $\mathrm{v} \in \mathrm{A}$ and $|\mathrm{A}|=2 \mathrm{n}-1 \Rightarrow \mathrm{v}$ does not commute with exactly one elements of $A \Rightarrow v \in A_{1} \cup\{u\}$ for some $u \in B$ $\Rightarrow A \subseteq A_{1} \cup\{u\}$ and also $A_{1} \cup\{u\} \subseteq A$ for some $u \in B$.
Consequently, $\mathrm{A}=\mathrm{A}_{1} \cup\{\mathrm{u}\}$.
(ii) Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $A=A_{1} \cup B$. Then, for $i \in\{0,1,2, \ldots, 2 n-1\}, C_{a} i$
$(X)\left(\mathrm{DiC}_{\mathbf{n}}, A\right)=\left\{\mathrm{a}_{\mathrm{x}}: \mathbf{j}=0,1,2, \ldots, 2 \mathrm{n}-1, j \neq \mathrm{i}\right.$ and $j \neq n+i\} \cup\left\{a^{j}: j=1,2,3, \ldots, n-1, n+1, \ldots, 2 n-1\right\} \Rightarrow \operatorname{deg} \Delta\left(a^{i} x\right)=$ $2(n-1)+(2 n-2)=4 n-4$ for each $\mathrm{a}^{\mathrm{i}} \mathrm{x} \in \mathrm{A}$. Similarly, for $i \in\{1,2, \ldots, n-1, n+1, \ldots, 2 n-1\}, C_{a} i\left(D_{i C n}, A\right)=\Phi \cup\left\{a^{j_{x}}: j\right.$ $=0,1,2,3, \ldots, 2 n-1\} \Rightarrow \operatorname{deg} \Delta\left(a^{i}\right)=2 n$ for each $a^{i} \in A$. Moreover, as $\mathrm{a}^{\mathrm{i}} \mathrm{x}$ commutes with $\mathrm{a}^{\mathrm{i}+\mathrm{n}_{x}}$ for each i in $A$. Therefore, there are $n+1$ partitions in A such that (a) one of order $2 \mathrm{n}-2$ and others n are of same order 2 .
(b) all elements of the same partition are isolated.
(c)each element of a partition is adjacent to all the elements of the remaining partitions. Thus, $K_{2 n-2,2,2, \ldots .2}$.
Conversely, assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $\Delta=K_{2 n-2,2,2, \ldots, 2}$. Let $v \in A \Rightarrow v \in V(\Delta)$ $\Rightarrow \operatorname{deg} \Delta(v)=2 n$ or $\operatorname{deg} \Delta(v)=4 n-4$. If $\operatorname{deg} \Delta(v)=2 n \Rightarrow v=$ $a^{i}$ for some $i \in\{1,2,3, \ldots, n-1, n+1, \ldots, 2 n-1\} \Rightarrow v \in A_{1} \Rightarrow v$ $\in A_{1} \cup B \Rightarrow A \subseteq A_{1} \cup B$. If $\operatorname{deg} \Delta(v)=4 n-4 \Rightarrow v=a^{i} x$
For some $i \in \quad\{0,1,2,3, \ldots, 2 n-1\} \Rightarrow v \in \quad B \Rightarrow \quad v \in$ $A_{1} \cup B \Rightarrow A \subseteq A_{1} \cup B$. Similarly, $A_{1} \cup B \subseteq A$. Consequently, $A=A_{1} \cup B$.
Corollary 3.6. For $n \geq 2$ and $\mathrm{A} \subseteq \mathrm{DiC}_{\mathbf{n}}$, if $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then,
(i) $\Delta=K_{2 n-2,2} \Leftrightarrow A=A_{1} \cup B_{i}$ for some $i \in I_{2}$ (ii) $\Delta=K_{2,2}$ if $A=B_{\mathbf{i}} \cup B_{\mathbf{j}}$, for $\mathbf{i} \neq \mathbf{j}$ and $\mathbf{i}, \mathbf{j} \in \mathrm{I}_{2}$. (iii) $\Delta=\mathrm{K}_{2,2, \ldots, 2} \Leftrightarrow \mathrm{~A}=$ B.

Theorem3.7.For $\mathrm{n} \geq 2$ and $\mathrm{A} \subseteq \mathrm{DiC}_{\mathbf{n}}$, if $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then,
(i) $\Delta=P_{2} \Leftrightarrow A=\{u, v\}$ for some $u \in A_{1}$ and $v \in B$ or $A$ $=\{u, v\}$ for $u \in B_{i}, v \in B_{j}$,
$\mathrm{i}=\mathbf{j}$ and $\mathrm{i}, \mathbf{j} \in \mathrm{I}_{2}$.
(ii) $\Delta=\mathrm{P}_{3} \Leftrightarrow \mathrm{~A}=\mathrm{B}_{\mathrm{i}} \cup\{\mathrm{u}\}$ for some $\mathrm{u} \in \mathrm{A}_{1}$ and $\mathrm{i} \in \mathrm{I}_{2}$ or $A=\{u, v\} \cup\{x\}$, where $u, v \in A_{1}$ and $x \in B$ or $A=$ $B_{i} \cup\{x\}$, where $x \in B_{j}, i=j$ and $i, j \in I_{2}$.
Proof. (i) (Case-i) Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a noncommuting graph such that $A=\{u, v\}$ for some $u \in A_{1}$ and $v \in B$. Since each element of $A_{1}$ does not commute with any element of $B$, therefore $u \in A_{1}$ does not commute with $v \in$ B .As $|A|=2$, therefore $\left|\mathrm{C}_{\mathbf{u}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)\right|=1=\mid \mathrm{C}_{\mathrm{V}}\left(\mathrm{DiC}_{\mathbf{n}}\right.$, A) $\mid \Rightarrow \operatorname{deg} \Delta(u)=1=\operatorname{deg} \Delta(v) \Rightarrow \Delta$ is a path graph of order 2 , i.e $\Delta=P_{2}$.
(Case-ii) Assume that $\Delta=\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $A=\{u, v\}$ for some $u \in B_{i}, v \in B_{\mathbf{j}}, i \neq \mathbf{j}$ and $\mathbf{i}, \mathbf{j} \in \mathbf{I}_{2}$. Since each element of $\mathrm{B}_{\mathbf{i}}$ does not commute with any element of $B_{\mathbf{j}}$ for $\mathbf{i} \neq \mathbf{j}$ and $\mathrm{i}, \mathbf{j} \in \mathrm{I}_{2}$, therefore $\mathrm{u} \in$ $B_{i}$ does not com- mute with $v \in B_{\mathbf{j}}$ for $\underline{i} \neq \mathbf{j}$ and $\mathbf{i}, \mathbf{j} \in I_{2}$. As $|\mathrm{A}| \quad=\quad 2$, therefore $\overline{\mathrm{C}_{\mathbf{u}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)}=1=\overline{\mathrm{C}_{\mathbf{V}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)} \Rightarrow \operatorname{deg} \Delta(\mathrm{u})=\operatorname{deg} \Delta(\mathrm{v}) \Rightarrow \Delta$ is a path graph of order 2, i.e $\Delta=\mathrm{P}_{2}$. Conversely, assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $\Delta$ $=P_{2}$. Let $x \in A \Rightarrow x \in V(\Delta) \Rightarrow x \in P_{2}$. As $P_{2}$ consists of exactly two vertices such that each vertex is of degree1, therefore $x \in\{u, v\}$ such that $\operatorname{deg} \Delta(u)=1=\operatorname{deg} \Delta(v)$. Since each element of $\mathrm{A}_{1}$ does not commute with any element of $B$ and each element of $B_{i}$ does not commute with any element of $B_{\mathbf{j}}$ for $\mathbf{i} \neq \mathbf{j}$ and $\mathrm{i}, \mathbf{j} \in \mathrm{I}_{2}$, therefore $\mathrm{x} \in\{\mathrm{u}$, $v\}$, where $u \in A_{1}$ and $v \in B$ or $u \in B_{i}$ and $v \in B_{j}$ for $i \neq j$ and $i, j \in I_{2}$. Consequently, $A=\{u, v\}$ for some $u \in A_{1}$ and $v \in B$ or $A=\{u, v\}$ for $u \in B_{i}, v \in B_{j}, i \neq j$ and $i, j \in$ I2.
(ii) (Case-i) Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a noncommuting graph such that $A=B_{i} \cup\{u\}$ for some $u \in A_{1}$ and $i \in I_{2}$. As, $\left|B_{i}\right|=2$ and $a^{i} x$ commutes with $a^{i+n_{x}}$ for each $i \in I_{2}$.
Moreover, $\mathrm{C}_{\mathbf{u}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)=\mathrm{B}_{\mathbf{i}}$ for each $u \in \mathrm{~A}_{1}$ and $\mathrm{i} \in \mathrm{I}_{2}$. Thus, two elements in A commute with each other and third does not commute with them $\Rightarrow$ degree of two vertices is 1 and third vertex is of degree 2 in then on-commuting graph $\Delta=$ $\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right] \Rightarrow \Delta=\mathrm{P}_{3}$.
Case-ii Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non- commuting graph such that $A=\{u, v\} \cup\{x\}$, where $u, v \in A_{1}$ and $x \in$ B. Consider, $\mathrm{C}_{\mathbf{u}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)=\{\mathrm{x}\}=\mathrm{C}_{\mathrm{V}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)$ and $\mathrm{C}_{\mathrm{X}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)=\{\mathrm{u}, \mathrm{v}\} \Rightarrow \operatorname{deg} \Delta(\mathrm{u})=1=\operatorname{deg} \Delta(\mathrm{v})$ and $\operatorname{deg} \Delta(x)=2$ in $\Delta=\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right] \Rightarrow \Delta=\mathrm{P}_{3}$.
(Case-iii) Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $A=B_{i} \cup\{x\}$, for $x \in B_{\mathbf{j}}, i=j$ and $i, j \in$ $\mathrm{I}_{2}$. Since both the elements of $\mathrm{B}_{\mathrm{i}}$ commute with each other for $i \in I_{2}$ and do not commute with $x \in B_{j}$, where $i=j$ and $\mathrm{i}, \mathbf{j} \in \mathrm{I}_{2} \Rightarrow \operatorname{deg} \Delta(\mathrm{u})=1=\operatorname{deg} \Delta(\mathrm{v})$ and $\operatorname{deg} \Delta(\mathrm{x})=2$ in $\Delta=\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right]$, where $\mathrm{u}, \mathrm{v}$ are in $\mathrm{B}_{\mathrm{i}}$ for some $\mathrm{i} \in \mathrm{I}_{2} \Rightarrow \Delta$ $=\mathrm{P}_{3}$.

Conversely, assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $\Delta=P_{3}$. Let $u \in A \Rightarrow u \in V(\Delta) \Rightarrow u \in P_{3}$. As two vertices are of degree 1 and one vertex is of degree 2 in $P_{3} \Rightarrow$ either $\operatorname{deg} \Delta(u)$ is 1 or 2 . If $\operatorname{deg} \Delta(u)=1$, then for other two vertices of $P_{3}$ say $v$ and $x$ are such that $\operatorname{deg} \Delta(v)$ $=1$ and $\operatorname{deg} \Delta(x)=2$. Consequently, $A=\{u, v\} \cup\{x\}$, where $u, v \in A_{1}$ and $x \in B$ or $A=B_{i} \cup\{x\}$, where $x \in B_{j}, i=j$ and $\mathrm{i}, \mathbf{j} \in \mathrm{I}_{2}$. If $\operatorname{deg} \Delta(\mathrm{u})=2$ then for other two vertices of $\mathrm{P}_{3}$ say v and x are such that $\operatorname{deg} \Delta(\mathrm{v})=1=\operatorname{deg} \Delta(\mathrm{x}) \Rightarrow \mathrm{v}$ and x commute but $u$ does not commute with them in $A \Rightarrow v$ and $x$ $\in B_{i}$ for some $i \in I_{2}$ and $u \in A_{1} \Rightarrow A=B_{i} \cup\{u\}$ for some $u$ $\in A_{1}$ and $i \in I_{2}$.
Corollary3.8. For $n \geq 2$ and $A \subseteq \operatorname{DiC}_{\mathbf{n}}$, if $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, A\right]$ is a non-commuting graph. Then, $\Delta=\mathrm{P}_{2}$ if $\mathrm{A}=\mathrm{D} \mathrm{i}=$ $\left\{a^{i}, a^{i} x\right\}$ for each $i \in I_{1}$.
Theorem3.9. For $\mathrm{n} \geq 3$ and $\mathrm{A} \stackrel{2}{\subseteq} \mathrm{DiC}_{\mathbf{n}}$, if $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then,
(i) $\Delta=C_{3} \Leftrightarrow A=\left\{a^{i}{ }_{x}, \mathrm{a}^{j_{x}}\right\} \cup\{u\}$, where $i, j \in I_{4}, i \neq j$, $j \neq n+I$ and $u \in A_{1}$ or $A=\left\{a^{i}{ }_{x}, a^{j_{x}}, a^{k} x_{x}\right.$, where $i, j, k \in$ $\mathrm{I}_{4}, \mathrm{i} \neq \mathrm{j} \neq \mathrm{k}, \mathrm{j} \neq \mathrm{n}+\mathrm{i}, \mathrm{k} \neq \mathrm{n}+\mathrm{i}$ and $\mathrm{k} \neq \mathrm{n}+\mathrm{j}$.
(ii) $\Delta=\mathrm{C} 4 \Leftrightarrow \mathrm{~A}=\mathrm{B}_{\mathrm{i}} \cup\{\mathrm{u}, \mathrm{v}\}$ for $\mathrm{u}, \mathrm{v} \in \mathrm{A}_{1}$ and $\mathrm{i} \in \mathrm{I}_{2}$ or $\mathrm{A}=$ $\mathbf{B}_{\mathbf{i}} \cup \mathbf{B}_{\mathbf{j}}$, for $\mathbf{i} \neq \mathbf{j}$ and $\mathbf{i}, \mathbf{j} \in \mathbf{I}_{2}$.
Proof.(i)(Case-i)Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a noncommuting graph such that $A=\left\{a^{i}{ }_{x}, a^{j_{x}}\right\} \cup\{u\}$, where $i$, $\mathbf{j} \in \mathrm{I}_{4}, \mathrm{i} \neq \mathbf{j}, \mathbf{j} \neq \mathrm{n}+\mathrm{i}_{2}$ and $\mathrm{u} \in \mathrm{A}_{1}$. Since, under the supposed conditions $\mathrm{a}^{\mathrm{i}} \mathrm{x}$ and $\mathrm{a}_{\mathrm{x}}$ do not commute, also u does not commute with $\mathrm{a}^{i} \mathrm{x}$ and $\mathrm{a}^{\mathrm{j}}$. Therefore, $\mid \mathrm{C}_{\mathrm{V}}\left(\mathrm{DiC} \mathrm{C}_{\mathrm{n}}\right.$, A) $\mid=2$ for each $v \in A \Rightarrow$ each element of $A$ has degree 2 in $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right] . \mathrm{As},|\mathrm{A}|=3 \Rightarrow \Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]=\mathrm{C} 3$.
(Case-ii) Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph such that $A=\left\{a^{i}{ }_{x}, a^{j_{x}}, a^{k_{x}}\right\}$, where $i, j, k \in I_{4}, i \neq j$ $\neq \mathrm{k}, \mathrm{j} \neq \mathrm{n}+\mathrm{i}, \mathrm{k} \neq \mathrm{n}+\mathrm{I}$ and $\mathrm{k} \neq \mathrm{n}+\mathrm{j}$. Under the supposed conditions, we note that each element of A do not commute with remaining two elements of $A \Rightarrow\left|\mathrm{C}_{\mathrm{V}}\left(\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right)\right|=2$ for each $\mathrm{v} \in A \Rightarrow$ each element of $A$ has degree 2 in $\Delta=$
 Conversely, Assume that $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a noncommuting graph such that $\Delta=\left[\mathrm{DiC}_{\mathrm{n}}, \mathrm{A}\right]=\mathrm{C}_{3}$. Let $\mathrm{v}_{1}, \mathrm{v}_{2}, \mathrm{v}_{3} \in \mathrm{~A} \Rightarrow \mathrm{v}_{1}, \mathrm{v}_{2}, \mathrm{v}_{3} \in \mathrm{~V}(\Delta) \Rightarrow \mathrm{v}_{1}, \mathrm{v}_{2}, \mathrm{v}_{3} \in \mathrm{C}_{3} \Rightarrow \mathrm{v}_{1}$, $\mathrm{v}_{2}$ and $\mathrm{v}_{3}$ do not commute with each other.
(Case-i) We have possibilities as (i) $\mathrm{v}_{1}, \mathrm{v}_{2}$ and $\mathrm{v}_{3} \in \mathrm{~A}_{1}$, (ii) any two say $v_{2}$ and $v_{3} \in A_{1}$ and (iii) only one say $v_{3} \in A_{1}$. The possibilities (i) and (ii) are not possible as each pair of elements commute in $\mathrm{A}_{1}$. The possibility (iii) holds, thus others elements $v_{1}, v_{2}$ are must in $B$ such that if $v_{1}=a^{i}{ }_{x}$ then $v_{2}=a^{n+I} x$ for $i \in I_{4}$. Thus, $v_{3} \in A_{1}$ and $v_{1}, v_{2} \in$ $\left\{\mathrm{a}^{\mathrm{i}} \mathrm{x}, \mathrm{a}^{\mathrm{j}} \mathrm{j}_{\mathrm{x}}\right.$, where $\mathrm{i}, \mathrm{j} \in \mathrm{I}_{4}, \mathrm{i}=\mathrm{j}, \mathrm{j}=\mathrm{n}+\mathrm{i}$. Clearly, $\mathrm{A} \subseteq$
 Consequently, $A=\left\{a^{i} x, a^{j_{x}} \cup\{u\}\right.$, where $i, j \in I_{4}, i=j, j$ $=\mathrm{n}+\mathrm{i}$ and $\mathrm{u} \in \mathrm{A}_{1}$.
(Case-ii) if $\mathrm{v}_{1}, \mathrm{v}_{2}$ and $\mathrm{v} 3 \notin \boldsymbol{A}_{1} \Rightarrow \mathrm{v}_{1}, \mathrm{v}_{2}$ and $\mathrm{v}_{3} \in B$ such that if $v_{1}=a^{i}{ }_{x}$, then $v_{2}=a^{j_{x}}$ and $v_{3}=a^{k_{x}}$ with $i, j, k$ $\in \mathrm{I}_{4}, \mathrm{i} \neq \mathrm{j} \neq \mathrm{k}, \mathrm{j} \neq \mathrm{n}+\mathrm{i}, \mathrm{k} \neq \mathrm{n}+\mathrm{i}$ and $\mathrm{k} \neq \mathrm{n}+\mathrm{j}$. Consequently, $A=\left\{\mathrm{a}^{\mathrm{i}} \mathrm{X}_{\mathrm{x}} \mathrm{a}^{\mathrm{j}_{\mathrm{x}}}, \mathrm{a}^{\mathrm{k}_{\mathrm{x}}}\right.$, where $\mathrm{i}, \mathrm{j}, \mathrm{k} \in \mathrm{I} 4, \mathrm{i} \neq \mathrm{j}$ $\neq \mathrm{k}, \mathrm{j} \neq \mathrm{n}+\mathrm{i}, \mathrm{k} \neq \mathrm{n}+\mathrm{I}$ and $\mathrm{k} \neq \mathrm{n}+\mathbf{j}$. (ii) Proof follows by Corollary (3.6) ((i) and (ii)).

Theorem3.10. For $\mathrm{n} \geq 2$ and $\mathrm{A} \subseteq \mathrm{DiC}_{\mathbf{n}}$, if $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then,
(i) $|\mathrm{E}(\Delta)|=0 \Leftrightarrow \mathrm{~A} \subseteq \mathrm{~A}_{1}$ or $\mathrm{A}=\mathrm{B}_{\mathbf{i}}$ for some $\mathrm{i} \in \mathrm{I}_{2}$.
(ii) $|\mathrm{E}(\Delta)|=2 \mathrm{n}(\mathrm{n}-1) \Leftrightarrow \mathrm{A}=\mathrm{B}$.
(iii) $|\mathrm{E}(\Delta)|=\mathrm{n}(\mathrm{n}-1) \Leftrightarrow \mathrm{A}=\mathrm{C}_{1}$ or $\mathrm{A}=\mathrm{C}_{2}$.(iV) $|\mathrm{E}(\Delta)|=$ $6 \mathrm{n}(\mathrm{n}-1) \Leftrightarrow \mathrm{A}=\mathrm{DiC}_{\mathrm{n}}-\mathrm{Z}\left(\mathrm{DiC}_{\mathrm{n}}\right)$.
Proof: (i) Let $A \subseteq A_{1}$ or $A=B_{i}$ for some $i \in I_{2}$. Since, each element of $A_{1}$ commute with all other elements of $A_{1}$ and similarly both the elements of $\mathrm{B}_{\mathrm{i}}$ also commute with each other, where $\mathrm{i} \in \mathrm{I}_{2} \Leftrightarrow \Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}_{1}\right]$ and $\Delta=$ $\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{B}_{\mathbf{i}}\right]$ for some $\mathrm{i} \in \mathrm{I}_{2}$ are empty graphs $\Leftrightarrow\left|\mathrm{E}\left(\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}_{1}\right]\right)\right|=0=\left|\mathrm{E}\left(\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{B}_{\mathbf{i}}\right]\right)\right| \Leftrightarrow$ $\left|\mathrm{E}\left(\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]\right)\right|=0 \Leftrightarrow|\mathrm{E}(\Delta)|=0$.
(ii) By Corollary (3.6 (iii)), $\Delta=\mathrm{K}_{2,2, \ldots, 2}$
$\Leftrightarrow A=B$. Thus, $|E(\Delta)|=\frac{1}{n}(n-1)(4)=2 n(n-1) \Leftrightarrow A=B$. (iii) By Corollary
(3.4(iii)), $\Delta=\mathrm{K}_{\mathrm{n}} \Leftrightarrow \mathrm{A}=\mathrm{C}_{1}$ or $\mathrm{C}_{2}$. Thus $|\mathrm{E}(\Delta)|={ }^{1}{ }_{\mathrm{n}}(\mathrm{n}-1)$ $\Leftrightarrow \mathrm{A}=\mathrm{C}_{1}$ or $\mathrm{C}_{2}$. (iv) By Theorem3.5 (ii) , $\Delta=$ $K_{2 n-2,2,2, \ldots .2} \Leftrightarrow$
$\mathrm{A}=\mathrm{A}_{1} \cup \mathrm{~B}$ Thus, $|\mathrm{E}(\Delta)|=2 \mathrm{n}(\mathrm{n}-1)+2 \mathrm{n}(2 \mathrm{n}-2)=6 \mathrm{n}$ $(\mathrm{n}-1) \Leftrightarrow \mathrm{A}=\mathrm{DiC}_{\mathrm{n}}-\mathrm{Z}\left(\mathrm{DiC}_{\mathrm{n}}\right)$.
Theorem3.11. For $\mathrm{n} \geq 2$ and $\mathrm{A}=\mathrm{DiC}_{\mathbf{n}}-\mathrm{Z}\left(\mathrm{DiC}_{\mathbf{n}}\right)$, if $\Delta$ $=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is a non-commuting graph. Then,
(i) $\omega(\Delta)=\chi(\Delta)=\mathrm{n}+1$
(ii) The grith of $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is 3 .
(iii) The maximal matching of $\Delta=\left[\mathrm{DiC}_{n}, \mathrm{~A}\right]$ is $\mathrm{D}=\left\{\mathrm{a}^{\mathrm{i}}\right.$ $\left.\mathrm{a}^{\mathrm{i}} \mathrm{x}: \mathrm{i} \in \mathrm{I}_{1}\right\}$ with $\gamma(\Delta)=2 \mathrm{n}-2$, which is not a perfect matching.
Proof: (i) By Theorem 3.3 (iii), $\Delta=\mathrm{K}_{\mathrm{n}+1} \Leftrightarrow \mathrm{~A}=\mathrm{C}_{1}$ $\cup\{u\}$ or $C_{2} \cup\{u\}$ for some $u \in A_{1} \Rightarrow \Delta=\left[\mathrm{DiC}_{n}, C_{1} \cup\{u\}\right]$ or $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{C}_{2} \cup\{\mathrm{u}\}\right]$ is a maximal complete subgraph with or der $\mathrm{n}+1$ of the non-commuting graph $\Delta=\left[\mathrm{DiC}_{\mathrm{n}}\right.$, A] $\Rightarrow \omega(\Delta)=\mathrm{n}+1$. By Theorem 3.5 (ii) $\Delta=$ $K_{2 n-2,2,2, \ldots .2} \Leftrightarrow A=A_{1} \cup B \Rightarrow \Delta$ is a complete $(n+1)-$ partitegraph $\Leftrightarrow \mathrm{A}=\mathrm{DiC}_{\mathrm{n}}-\mathrm{Z}\left(\mathrm{DiC}_{\mathrm{n}}\right)$. Thus, $\mathrm{n}+1$ colors are required to colour the complete $(\mathrm{n}+1)$-partite graph. Thus, $\chi(\Delta)=\mathrm{n}+1$. Consequently, $\omega(\Delta)=\chi(\Delta)=\mathrm{n}+$

1. The non-commuting subgraph of $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ induced by $\mathrm{C}_{1}$ is a complete graph of order n (Corollary3.4). So completeness of this implies that there exists at least one cycle of minimum length 3 . So, $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ has grith 3 .
(iii) By Corollary 3.8, $\Delta=P_{2}$ if $A=D_{i}=\left\{a^{i}, a^{i} \mathrm{x}\right\}$ for each $i \in I_{1}$ Thus, for each $i \in I_{1}, a^{i} a i_{x}$ is $P_{2}$ with different end points and $\left|I_{2}\right|=2 n-2$, where $a^{i} \in A_{1}$ and $a^{i}{ }_{x} \in B$ .As $\left|\mathrm{A}_{1}\right|=2 \mathrm{n}-2,|\mathrm{~B}|=2 \mathrm{n}$ and $\mathrm{n}, 2 \mathrm{n} \notin \mathrm{I}_{2} \Rightarrow$ we leave only two vertices $x$ and $a^{n} x$ which are not end of any $P_{2}$ in $D=$ $\left\{a^{i} a^{i} x: i \in I_{1}\right\}$, otherwise we get edges with common vertex. Consequently the maximal matching of $\Delta=\left[\mathrm{DiC}_{\mathbf{n}}, \mathrm{A}\right]$ is D $=\left\{\mathrm{a}^{\mathrm{i}} \mathrm{a}^{\mathrm{i}} \mathrm{x}: \mathrm{i} \in \mathrm{I}_{1}\right\}$ with $\gamma(\Delta)=2 \mathrm{n}-2$. As $\gamma(\Delta)$ is not equal to the half of $\left|\mathrm{DiC}_{\mathrm{n}}-\mathrm{Z}\left(\mathrm{DiC}_{\mathrm{n}}\right)\right|$, therefore matching is not perfect.
